49.5. practice: binding and bonding

1. Add an extra **ip address** to one of your network cards. Test that it works (have your neighbour ssh to it)!

2. Use **ifdown** to disable this extra **ip address**.

3. Make sure your neighbour also succeeded in **binding** an extra ip address before you continue.

4. Install OpenSSH Server

5. Configure the newly installated openssh server to bind and listen only to the specific ip address(only the one added in the previous section)

6. Use netstat and/or external machine to verify the listener address.

7. Add an extra network card (or two) to your virtual machine and use the theory to **bond** two network cards.

Good luck, have fun. ;]
